What's New In FreePaK?

This is a free self extracting archive viewer which creates encrypted self extracting archives. It is a portable version of FreePaK from the official website. There are many additional features in FreePaK including the ability to add custom extensions for encryption, password protection and more. The typical use case for this program is to create an .rar,.exe,.zip or similar archive, and run FreePaK on the file. If you use FreePaK to create the archive, the original file name remains unchanged. That is, if you create a zip file called "MyZipFile.zip", FreePaK will call it "MyZipFile.zip" in the archive. Installation: * It is assumed you have unpacked the program into a directory called "FreePaK". * You can skip all the other steps for installation. Simply run the "setup.exe" file. * Then follow the instructions to change the defaults to whatever you want. * Alternatively, if you want, you can uninstall the program by running "FreePaK\setup.exe -uninstall". * To re-install the program, run the setup again. * If you have multiple user accounts on your system, you can install the program into one or more specific accounts by using the same setup process. Simply set the correct username and password for the desired account and then set the target to the location of the FreePaK folder for that user. * A full install will require approximately 1-2 MB of space. File Format: * RAR & ZIP archives are available as well as traditional.exe files * Self extracting archives (aka ".exe files" and ".zip files") are automatically created with default settings. * Custom archives are easily created by setting the "customextension" key and setting it to your desired extension. After creating an archive, it can be opened in FreePaK or simply extracted by running it using the "open" command. However, "open" can also be used to extract archives created by other archivers, such as WinRAR. Creating a custom archive is easy. Simply create a file with the same file name as the archive file you wish to create and then fill it with the appropriate settings. The contents of the file will be written to the archive's location (typically at the end of the archive). There are also some example files that can be used to test the program. The program has built in support for encrypting archives. It supports a variety of standard encryption methods, including AES, 3DES, Blowfish and others. When you create an archive, the encryption password can be any valid string. Example of settings in.conf file:
